Baker Beach Geotechnical Investigation Debris Stability Data Package No. 2

Dear Mr. Boggs:

On behalf of the Presidio Trust, enclosed please find for your review a data package from our ongoing Baker Beach geotechnical program, which constitutes our second geotechnical sample testing and first analytical sample testing submittal. Also included is the updated table showing environmental samples collected. The documents included in this transmittal are draft, and will be included in final form in the report. The report will be signed and stamped by a registered engineer. These samples were obtained from test trenches, borings, and hand augers as part of the Battery and Equipment Stability evaluation. The data package includes:

- Updated tables (2a-2i) that show both proposed samples and testing (Table 2 of the most recent Field Sampling Plan) and the samples collected to date and submitted for geotech analysis;
- Preliminary test boring and cultural resource trench logs (including showing where the samples were collected); and
- Table that shows analytical samples collected to date and submitted for analysis.

Jim French, geotechnical engineer, and Anna Henke, geologist, reviewed the draft test pit logs and the samples, and assigned the geotechnical index and strength tests based on sample interval, sample recovery and condition and soil type. All samples intended for geotechnical testing were taken with thin-wall Shelby tubes unless noted on the table.

Gary Lieberman, geologist, and Ms. Henke reviewed samples taken from cultural resource trenches and other locations.

The tables and testing program are preliminary and may be revised as additional information is developed. Additional undisturbed samples will be obtained from the remaining soil borings and submitted for geotechnical and environmental laboratory analysis as part of the limited access drill rig evaluations in May.

[a] Sample ID will be date that duplicate sample is collected

[b] Depth as well as precise sample location will be determined in the field on the basis of the presence of observed historical fill material

[c] Samples analyzed for dioxins and furans if ash is found and sampled

[d] Both filtered (dissolved metals) and unfiltered (total metals) samples will be collected and analyzed.

[e] Extract only - hold for analysis

* Waste fill not identified in these borings; therefore, samples were not collected.

** For Trench 4 (Data Gap 3) incinerator ash was not observed; therefore, samples were not analyzed for Dioxins / Furans.

*** BB1SB110 and B1SB111 renamed BB1SB113 and B1SB114, respectively.

Piezometer sample to be collected by 5/27/05.

CHERT FILL – REDDISH BROWN WELL-GRADED GRAVEL WITH SAND (GW) (5YR 4/3) DENSE. DRY. 80% GRAVEL (ANGULAR) 15% SAND 5% FINES

SAND – DARK YELLOWISH BROWN SILTY SAND (SM) (10YR 4/4) DENSE. MOIST. 80% VERY FINE SAND 20% SILT. SOME FeO_2 STAINING IN PATCHES

GRAVEL FILL – DARK GREY TO BROWN SILTY GRAVEL WITH SAND (GM) (10YR 4/1 – 10YR 5/3) LOOSE TO MEDIUM DENSE. DRY TO MOIST. 60% ANGULAR GRAVEL 20% SAND 20% SILT/FINES. PLACED IN LIFTS DISTINGUISHED BY COLOUR CHANGE.

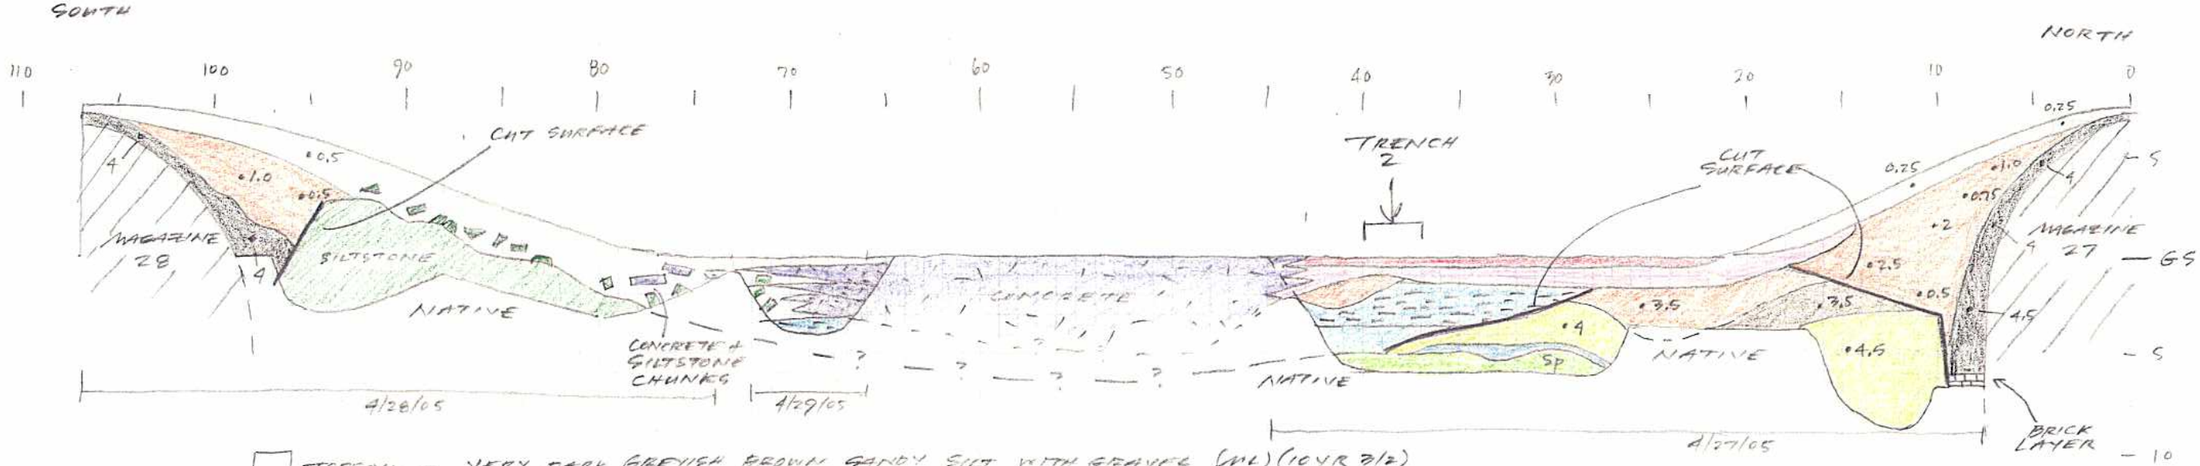
SILT – VERY DARK GREYISH BROWN (CLAYEY) SILT (ML) (10YR 3/2) HARD. DRY TO MOIST. 70% SILT. 30% CLAY. NATIVE OR DISTURBED NATIVE.

CLAY – YELLOWISH BROWN LEAN CLAY (CL) (10YR 5/6) HARD. MOIST. 90-100% CLAY. SOME FINE SAND. FeO_2 MOTTLE AND BLACK OXIDES ALONG FRACTURES

DEBRIS FILL – GREY WELL-GRADED GRAVEL WITH SAND (GW) (2.5YN 5/0) LOOSE. DRY. 60% GRAVEL. 20% SAND. 20% DEBRIS – INCL. CONCRETE, METAL, ASH, GLASS.

SERPENTINITE

TRENCH 1



TOPSOIL – VERY DARK GREYISH BROWN SANDY SILT WITH GRAVEL (ML)(10YR 3/2) SOFT. DRY TO MOIST. GENERALLY 60% SILT 20% SAND 20% GRAVEL

MIXED CLAY FILL – MIXTURE OF YELLOWISH BROWN (10YR 5/6) AND VERY DARK BROWN (10YR 2/2) LEAN CLAY (CL) SOFT. MOIST., 80% CLAY 20% SILT. OCCASIONALLY SANDY.

CONSTRUCTION CLAY – BLACK LEAN CLAY (CL) (10YR 2/1) HARD TO VERY HARD. MOIST. 100% CLAY. COMPACTED ON SIDES OF STRUCTURES.

CONCRETE – MULTIPLE LAYERS OF CONCRETE AND CEMENT GROUT (SOME WITH COLOURING AGENTS ADDED) PRESUMED TO BE AN OLD WASH OUT AREA.

CHERT FILL (1) – DARK REDDISH BROWN WELL GRADED GRAVEL WITH SAND (GW)(5Y 3/3) DENSE. DRY. 70% GRAVEL (ANGULAR CHERT TO 1.5" Ø) 20% SAND <10% FINES

CHERT FILL (2) – AS ABOVE, BUT LIGHTER COLOUR - REDDISH GREY (5Y 5/2)

FILL SAND (1) – VERY DARK GREY POORLY GRADED SAND WITH CLAY INCLUSIONS (SP)(5Y 3/1) LOOSE TO MEDIUM DENSE. DRY TO MOIST. 70% SAND. 30% YELLOWISH BROWN CLAY.

FILL SAND (2) – VERY DARK GREY POORLY GRADED SAND (SP)(5Y 3/1) LOOSE TO MEDIUM DENSE. MOIST. 100% SAND.

NATIVE MATERIALS

SILTSTONE – OLIVE GREY SILTSTONE (5Y 5/2)( ) MODERATELY CONSOLIDATED. CLOSELY FRACTURED LOW HARDNESS. WEAK. DEEPLY WEATHERED

CLAY (1) – VERY DARK GREYISH BROWN LEAN CLAY (CL)(10YR 3/2) HARD. MOIST. 80% CLAY 15% SILT 5% VERY FINE QUARTZ SAND.

CLAY (2) – YELLOWISH BROWN LEAN CLAY (CL)(10YR 5/6) HARD. MOIST., 100% CLAY. WITH FeO_2 MOTTLE, AND BLACK OXIDATION ALONG FRACTURES. IN PLACES RESEMBLES WEATHERED ROCK.

SAND – DARK GREYISH BROWN SILTY SAND (SM)(2.5Y 4/2) DENSE. WET. 60% VERY FINE SAND 40% SILT/FINES. HAS BEDDING PLANES. THIN LAMINATIONS.

SERPENTINITE – LIGHT OLIVE BROWN (2.5Y 5/3) TO GREENISH GREY (5BG 5/1). MODERATELY CONSOLIDATED. INTENSELY FRACTURED. LOW TO MODERATE HARDNESS. FRIABLE TO WEAK. DEEPLY WEATHERED.

Baker Beach Geotechnical Investigation Debris Stability Data Package No. 3

Dear Mr. Boggs:

On behalf of the Presidio Trust, enclosed please find for your review a data package from our ongoing Baker Beach geotechnical program, which constitutes our final geotechnical sample testing submittal. Included are updated tables showing geotechnical samples collected. The documents included in this transmittal are draft, and will be included in final form in the report. The report will be signed and stamped by a registered engineer. These samples were obtained from borings as part of the Battery and Disturbed Area Stability evaluation. The data package includes:

- Updated tables (2a-2i) that show both proposed samples and testing (Table 2 of the most recent Field Sampling Plan) and the samples collected to date and submitted for geotech analysis; and

- Preliminary test borings and hand auger borings (showing where the samples were collected).

Jim French, geotechnical engineer, reviewed the draft drill logs and the samples, and assigned the geotechnical index and strength tests based on sample interval, sample recovery and condition and soil type. All samples intended for geotechnical strength testing were taken with thin-wall Shelby tubes unless noted on the table.

The tables and testing program are preliminary and may be revised as additional information is developed.

1 INTRODUCTION

SOHA Engineers was retained by the Presidio Trust to perform a condition assessment of historic fortifications located on the coastal bluffs southwest of the Golden Gate Bridge within Fort Winfield Scott at the Presidio of San Francisco,. The assessment is intended to record the conditions of the fortifications before, during and after the Baker Beach 1, 1A, 2 and 2A Landfill Removal Project planned for the adjacent area.

This effort is not intended as an assessment of historic significance of any element of the fortifications, nor is it intended to serve as any part of a historic structures report.

Fortifications included are Battery Godfrey, Battery Boutelle, Battery Marcus Miller, and five buried brick magazines numbered 21, 22, 27, 28 and 29. There is an additional magazine incorporated in and only accessible from Battery Godfrey.

This assessment report of pre-construction conditions includes a narrative description of the construction and general condition of the fortifications, a photo log with an image and brief description of each condition noted, schematic plans sketches showing each photo locations, and a summary of items of note or considered potentially hazardous. The photo log, sketches and a CD with all photographs in digital media are included separately as Appendix A.

Also included is an assessment of the structural integrity of Battery Boutelle with specific emphasis on the horizontal cracks up to 3 inches wide along the gun pit parapets, and a discussion of possible construction loading for material removal at Gun Pit #1 at Battery Marcus Miller.

1.1 METHODOLOGY

1.1.1 Field Work

The field investigation was conducted by a two-man team comprised of an engineer and a drafting technician. Only visual means were used to locate and identify existing conditions. No finishes were removed and no stored materials or debris were moved to uncover hidden conditions. No destructive or non-destructive testing was performed to ascertain material strengths, member thickness, or reinforcement.

Access to the interior spaces of the fortifications was arranged by the Presidio Trust. Lighting, ventilation, and air quality monitoring was provided by the SOHA Engineers team. We assisted as required in providing safe access to interior spaces for Presidio Trust and National Park Service personnel and other stakeholders interested in the condition of the fortifications.

Prior to the field investigation, we reviewed available documentation (see below) regarding the history and construction of the affected fortifications (and other similar fortifications) and prepared schematic plan sketches for use in documenting conditions.

1.1.2 Condition Assessment Format

The field investigation team located and took digital photographs of all existing damage conditions noted on exposed interior and exterior surfaces. Each photograph is identified on the plan sketches by a circled number corresponding to the file number of the digital photo. Circled numbers with an arrow indicate that the condition noted is on the vertical surface to which the arrow is pointing. Circled numbers without

an arrow indicate a condition noted on a horizontal floor or ceiling soffit. Although each photograph number is unique, as the field investigation of any one structure was performed at different times, photograph numbering is not always sequential for the entire structure. For example, Battery Boutelle is recorded in photographs numbered 64 – 94, 181 – 189, and 450 – 562. The photo log is organized by structure name, with photographs in numerical order. Interior photographs are shown first, followed by exterior photographs. In the photo log, the location of each photograph is described by reference to a room letter (shown on the sketches) for interior conditions, followed by an indication of which wall is represented (north, south, east, or west) or which surface (ceiling, floor). Exterior locations are referenced to the Gun Pit number, and the appropriate feature. Additional direction (north, south, east, west, or center) following indicates which portion of the wall or surface is represented. For example:

Room A, Ceiling, Center = Room A, center portion of the ceiling.

Room B, West, North = Room B, west wall, north end.

GP-3, Parapet, North, East = Gun Pit 3, north parapet, east end.

GP-2, Apron, South, Center = Gun Pit 2, south end, center portion.

In the photo log, the magazines are included separate from the batteries except that the sketch of Magazine 22 is included with Battery Boutelle. The magazine that is attached to and only accessible from Battery Godfrey is included with Battery Godfrey.

1.1.3 Evaluation

The evaluation of the existing cracking noted in Battery Boutelle and the capacity of the structure of Gun Pit #1 at Battery Marcus Miller to carry construction loads is based on review of available data, visual observations at the site and engineering judgment. Since the available data do not include detailed information on concrete thickness and reinforcement, no calculations have been performed.

1.1.4 Resources

The following documents were used for this assessment and report:

- Seacoast Fortifications Preservation Manual; Prepared by the National Park Service.
- Report of Completed Works – Seacoast Fortifications, Battery Godfrey (Completion Report)
- Report of Completed Works – Seacoast Fortifications, Battery Boutelle (Completion Report)
- Report of Completed Works – Seacoast Fortifications, Battery Marcus Miller (Completion Report)

2 FORTIFICATION DESCRIPTIONS

2.1 GENERAL

The magazines included in this assessment were originally constructed as part of Fort Winfield Scott's West Battery in the period after the Civil War. The surviving magazines are generally brick masonry arch structures covered with earth. The masonry is well-constructed and features well-detailed vaulting at arch intersections. Many wall areas have been painted or plastered. The floor of the magazines is sometimes concrete and sometimes bitumen. No drawings were located detailing the construction of the magazines.

The Endicott era batteries Boutelle, Godfrey, and Marcus Miller were originally constructed between 1891 and 1901, with modifications and repairs continuing until at least 1917. Their construction eliminated most of the West Battery fortifications on the same site. The Endicott era batteries continued to use earth cover as protection from projectiles but the structure beneath was now concrete instead of brick masonry.

No specific structural drawings were located for the original construction of the batteries included in this assessment. However, section drawings of similar batteries, and the sections included in the Completion Report sketches indicate that the original construction can typically be characterized as mass concrete at and forward of the gun pits and at the associated magazines, with a combination of earth and concrete of unknown thickness at the blast aprons or forward slopes. We were not able to determine the actual in-place construction of the aprons or forward slopes. It seems likely that there is earth and/or sand fill under the concrete at the exposed apron surfaces in some locations.

The below-grade shell rooms, powder rooms, and interior passages associated with each gun pit at batteries Godfrey and Marcus Miller feature flat-arched concrete roofs, assumed to be quite thick, and thick concrete walls and foundations. These below grade rooms are accessed from a sunken road supported by concrete retaining walls. At these batteries, the below-grade area appears to have been

enlarged after 1904 to include a hoist room below with a reinforced concrete column, beam and slab structure referred to as a splinterproof to cover the hoist mechanism above.

The Seacoast Fortifications Preservation Manual (the Manual) discusses the evolution of concrete construction during the Endicott era. Concrete of the original construction appears to be both plain (unreinforced) concrete, and reinforced concrete. Reinforcing is thought to include steel cables, steel rail sections and I-beams , and smooth or twisted steel bars. Cables and rails were often used in the mass concrete at the gun platforms and the longer span roof decks were often reinforced with steel I-beams located at the bottom of the thick section. The deck extensions and splinterproofs added to Battery Marcus Miller and the splinterproof added to Battery Godfrey after 1904 include beam, column, wall, and slab elements that are reinforced with twisted steel bars that function similarly to modern deformed reinforcing.

The Manual also describes the changes in concrete materials and mixing that occurred during the construction of the Endicott era batteries. The use of different Portland cements is discussed as is the use of large stones, broken concrete, and hardened bags of cement along with the machine-mixed or hand-mixed concrete made with sand and gravel.

Concrete surface finishes are quite varied. Interior wall and ceiling areas are typically plastered and painted. Although the manual discusses the use of bitumen flooring, all interior floors are jointed concrete. Exterior wall finishes vary from exposed board-formed pattern to a parged cement plaster coating.

The heavy mass concrete used at the gun pits was found to result in differential soil settlement beneath the foundations with respect to the magazines and other more lightly loaded rooms located adjacent. This resulted in Army engineers creating deliberate planes of weakness and separation between portions of the structures in an effort to control cracking and the water intrusion that resulted. Lead flashing was often used at such joints.

The fortifications are all located near the bluff edge, with Battery Boutelle located closest to the edge. Major excavation was typically required for foundation construction along with backfill of the completed structure.

2.2 BATTERY GODFREY

2.2.1 Construction

Battery Godfrey was constructed between 1892 and 1896. There are three gun pits, each with an associated magazine area below(shell room, powder room, hoist room and passages), and a splinterproof and telephone booth above. The splinterproof at Gun Pit #1 has been infilled with concrete masonry units to create an interior space. There are also several concrete rooms located at the north end of Gun Pit #1 identified as a store room, latrine, oil room, engine room and radiator room. These at-grade rooms, which are not covered with earth, provide access to the older buried brick magazine structure which was incorporated into Battery Godfrey. The flat concrete roof structure at these rooms is reinforced with steel I-beams.

It is known that embedded iron streetcar cables and rails were used as reinforcing for the mass concrete of the gun platform. Other sections of the original battery construction are thought to be unreinforced. The splinterproofs and telephone booths are reinforced with twisted square steel reinforcing bars.

Lead joints were noted in several areas.

The sections included with the Completion Report for Battery Godfrey indicate that mass concrete extends out beyond the parapet at the gun pits and extends even farther out west of the magazines below. The surface of the blast aprons at the gun pits and above and forward of the magazines below are typically exposed and jointed concrete, with some areas still covered with thick bitumen used as waterproofing. It appears that the apron at the gun pits extends west beyond the mass concrete below, while the apron at the magazines extends west the same distance as the mass concrete below.

The older brick magazine located north of Gun Pit #1 is constructed of brick masonry with vaulted barrel arches covered with earth.

2.2.2 Condition

Although the surface of the concrete at Battery Godfrey displays cracking, spalling, staining, powdery and solid efflorescence, offsets, rusted reinforcing, dampness, and peeling paint, no conditions were noted that would indicate any overall instability in the structure.

Of note are the circumferential cracks up to ¼ inch wide noted at the west end of the passage into the magazine areas at Gun Pits #2 and #3 (see also photos 97, 118, 119):

PHOTO 95

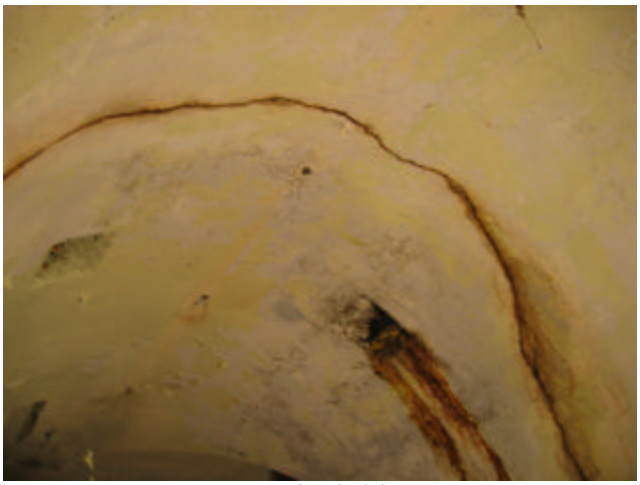

PHOTO 96

These cracks could be indicative of differential settlement between the heavier mass concrete of the magazine structure and the more lightly loaded passage area. Similar cracks were noted at Battery Marcus Miller.

Also of note are the substantial spalls and associated rusted, damaged, or missing reinforcement at the beams and columns of the splinterproofs. The photos shown below are typical of this condition:

PHOTO 241

PHOTO 243

Please see the Condition Summary section of this report for a discussion of falling or failure hazards associated with these conditions.

Rusting of the steel I-beams reinforcing the roof structures of the at-grade rooms at the north end of Battery Godfrey has typically resulted in spalling of the thin soffitt concrete cover over the bottom flange of the beams. The steel of the bottom flange is often substantially rusted and delaminated. This condition is probably associated with water intrusion through the roof concrete, which appears to have been coated with bitumen at one time.

PHOTO 179

PHOTO 180

The brick magazine connected to Battery Godfrey is in generally good condition, with areas of efflorescence at the mortar joints and clear evidence that many joints have been repointed. Continuing moisture intrusion after the repointing has resulted in spalling of the repointed joints (Photos 172, 173 and 174).

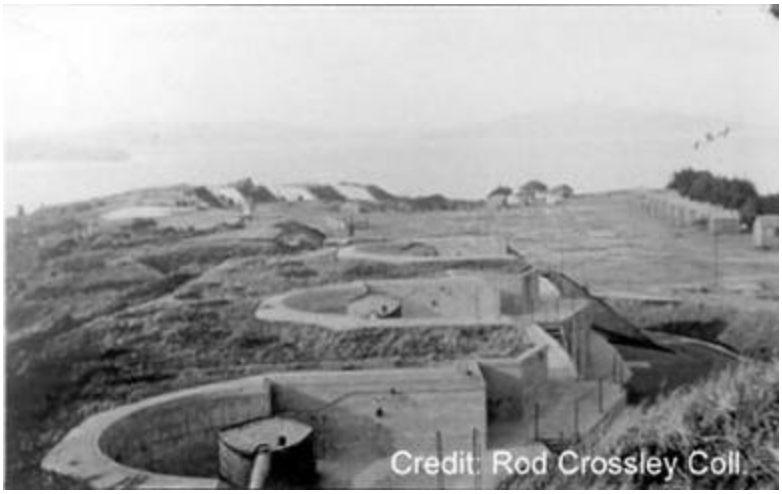
2.3 BATTERY BOUTELLE

2.3.1 Construction

Battery Boutelle was constructed from 1898-1901. There are three gun pits, each with a magazine room below and east of the gun mount. The gun mount features a steel cylinder extending down to the level of the room below. There is one additional underground room, identified as the Commanding Officer's Room, located between Gun Pits #2 and #3.

The Manual indicates that the roofs of the magazines are reinforced with steel I-beams. The concrete of the roofs appears to be at least 3 feet thick.

The apron appears to have been constructed at a later date, based on the archival photograph below, which shows the gun pits and parapet without an apron:



The section shown in the Completion Report for Battery Boutelle does not indicate any mass concrete extending beyond the west edge of the parapet at the gun pit. It appears that the apron was placed on backfill material.

2.3.2 Condition

The surface of the concrete at Battery Boutelle shows the typical damage conditions associated with age and lack of maintenance.

The major damage noted is the horizontal cracks along the tops of the parapets at each gun pit:

PHOTO 487

PHOTO 489

These cracks are up to 3 inches wide and show evidence that the portion above the crack has rotated with respect to the portion of the parapet wall below. No reinforcement was noted passing through the cracks. Please see the section "Battery Boutelle Assessment" for a discussion of this condition.

Although the Manual reports that steel I-beams were used as reinforcing for the magazine roofs, no spalling concrete was noted and the bottom flanges of the I-beams were not exposed except at the door header at the magazine at Gun Pit #1 (Photo 90).

No evidence of settlement commensurate with the size of the horizontal cracks seen in the parapet walls above was noted in the magazine rooms.

At the aprons, cracking consistent with the shape of the parapet walls below was noted in all three gun pits:

PHOTO 502

Portions of the apron between the gun pits have settled substantially, possibly due to consolidation of the backfill placed between and behind the gun pits:

Photo 545

2.4 BATTERY MARCUS MILLER

2.4.1 Construction

Battery Marcus Miller was constructed from 1891-1898 using a combination of hand mixed and machine mixed concrete. Construction and layout is very similar to that of Battery Godfrey except that there is a narrow underground passage behind (east of) the gun pits and the gun pit decks were extended to the east after 1905 using a concrete beam, column, and slab system reinforced with twisted steel reinforcing bars. The roof of the passage is reinforced with closely-spaced steel I-beams.

There are ancillary at-grade rooms labeled as spare rooms, guard room, latrine and engine room located east and north of Gun Pit #3, and an additional room north and east of Gun Pit #2. The roof structure of these rooms appears to be supported with closely spaced steel I-beams.

There is also a tower structure and catwalk with similar construction as the deck extension located above the magazine entrance at Gun Pit #2.

The layout of the mass concrete and aprons at the gun pits and magazines appears to be similar to that of Battery Godfrey. The aprons at the magazines typically feature a 6 foot by 6 foot grid of grouted joints in the concrete surface. A small area of thick bitumen surfacing remains at Gun Pit #1.

Currently, the Golden Gate Bridge District is using portions of Battery Marcus Miller for storage.

2.4.2 Condition

Although the surface of the concrete at Battery Marcus Miller displays cracking, spalling, staining, powdery and solid efflorescence, offsets, rusted reinforcing, dampness, and peeling paint, no conditions were noted that would indicate any overall instability in the structure.

The floor area at the magazine at Gun Pit #3 was wet and filled with several inches of mud. The other magazines were generally dry with patches of dampness.

Exposed, rusting steel beams were noted in the ceiling soffits of some ancillary rooms.

Of particular note is the condition of the beams, columns, and slabs of the deck extensions. In many areas, rust damage to steel reinforcing is widespread and serious:

PHOTO 612

PHOTO 711

Please see the Condition Summary section of this report for a discussion of falling or failure hazards associated with these conditions.

2.5 MAGAZINES

2.5.1 Magazines 27, 28 and 29

Magazines 27, 28 and 29 are nearly identical in construction. The buried portions include a circular vaulted masonry arch at the end of narrower arched passages. Most wall areas are plastered or whitewashed. A bitumen floor was noted in Magazine 28. The entry to each magazine consists of two brick masonry retaining walls with sloped tops ending in an arched doorway.

Only minor cracking was noted at these magazines. No evidence of instability was noted. Water intrusion was prevalent, with the floor of Magazine 27 covered with one inch of mud and the floor of Magazine #29 covered with 1 inch of damp sand.

2.5.2 Magazine 21

Magazine 21 is also a vaulted brick masonry arch structure covered with earth. There are two wide rooms, with the westernmost room longer than the other, connected to an entry passageway oriented 90 degrees from the main rooms. The floor is bitumen.

A major crack was noted in the north wall of the main vaulted room, extending up the north wall (Photo 1) and intersecting with the east wall of the room at the crown of the arch (Photo 2), then continuing as a separation at the joint along the wall and vault intersection (Photo 3) before extending into the wall pier at the passageway between the two main rooms (Photo 4):

PHOTO 1

PHOTO 2

PHOTO 3

PHOTO 4

This crack and separation appear to indicate settlement and some translation of the westernmost portion of the magazine. The location of the magazine with respect to the coastal bluff adjacent suggests that there may be some movement of the soil towards the bluff top.

2.5.3 Magazine 22

Magazine 22 is also a vaulted brick masonry arch structure covered with earth. There is one wide room at the end of a long narrow passage. The section of passage closest to the entry appears to have constructed of concrete with a flat ceiling, probably as part of modifications made along with the construction of Battery Boutelle adjacent. The floor is bitumen.

Only minor cracking was noted. There was no indication of instability or ground movement.

3 BATTERY BOUTELLE ASSESSMENT

3.1 BATTERY BOUTELLE INVESTIGATION

In addition to the condition assessment, a structural field investigation of Battery Boutelle was performed by Art Dell and Mogens Hansen on June 23, 2005 and again by Art Dell on July 15, 2005. Only visual observations were made, augmented by level measurements using a 4-foot carpenter's level.

The investigation was focused on the large horizontal cracks just below the top of the parapet at each gun pit (Photos 545–549). All other portions of the battery were carefully inspected for evidence of settlement or distress that could be related to the horizontal cracking or symptomatic of conditions that could cause such cracking.

As shown in Photos 487 and 489 included in Section 2.3.2, the horizontal cracking is irregular and does not appear to be associated with a later placement of a cap on the parapet.

At Gun Pit #1, there is a ¼ inch offset in the parapet above the crack with respect to the area below the crack, and the face of the parapet wall above the crack has rotated approximately ¼ inch in 3 feet with respect to vertical. At Gun Pit #2, where the horizontal crack is the widest, the offset is as much as ½ inch, with rotation of 2 inches in 3 feet. At Gun Pit #3, the offset is only 1/8 inch with rotation of 1 inch in 3 feet. Similar rotations were noted in the portions of the apron immediately west of the parapet.

At the aprons immediately above the parapets, cracking in the concrete was noted that closely follows the outline of the parapet walls below, as discussed in Section 2.3.2.

Substantial settlement (up to 6 inches) was noted in the aprons between the gun pits (see Photo 545 in Section 2.3.2).

3.2 BATTERY BOUTELLE EVALUATION

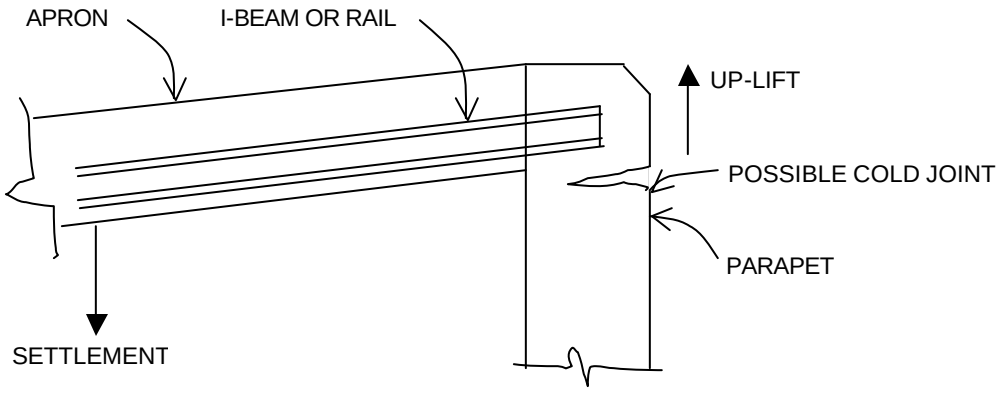
As discussed previously, it appears that the aprons were placed after completion of the battery structure (see the archival photo included in Section 2.3.1). In that photo, the octagonal outline of the west side of the parapet wall is visible.

As the construction of the battery would have required an excavation of at least 18 feet deep, it is likely that the area west of the parapet wall and beneath the concrete apron surface contains fill of substantial depth. This is distinct from the condition at the other batteries where mass concrete extends beyond the parapets.

It appears likely that the cracking is associated with settlement of the backfill under the apron or with movement of the soil mass west of the parapet towards the coastal bluff top. This is supported by the evidence of the adjacent settlement of apron elements between gun pits which are not bearing on elements with deep foundations below. However, unless the apron is tied into the top of the parapet wall with steel elements of sufficient bending capacity to overcome the weak tensile capacity of the concrete in the parapet wall, such settlement or soil movement would be more likely to simply separate the apron from the parapet wall rather than to lift up the top portion of the wall.

One possible scenario is that the apron was connected to the top of the parapet wall using steel I-beams or rail sections set into pockets chipped into the back of the parapet wall and sealed with cement grout or molten sulfur. This would result in a system stiff and strong enough to lift up the top of the parapet wall

as the soil settlement or movement brought the western edge of the apron down. The presence of a cold joint in the wall concrete would make this mechanism easier to achieve:



SECTION AT APRON/PARAPET

3.3 BATTERY BOUTELLE RECOMMENDATIONS

The scenario presented above as a possible explanation of the serious cracking at Battery Boutelle is speculative, and only based on visual observations and engineering judgment. However, it does not appear likely that the cracking is indicative of any overall instability of the structure. If it is deemed desirable to further investigate the construction of the apron and parapet to attempt to verify the scenario presented, non-destructive testing using Ground Penetrating Radar or more conventional metal detection equipment could be used to locate any embedded steel reinforcing. In addition, a 2 inch to 3 inch diameter core through the apron concrete would possibly be informative. This work could be performed by most any local Testing Agency. However, we do not feel that this effort would be justified provided the recommendations below are implemented.

It remains possible that the soil movement that has caused the cracking is not only local consolidation of backfill material but is related to movement of the block of soil adjacent to the bluff top. Evaluation of bluff stability is beyond the scope of this report. We understand that some geotechnical investigation has been performed for the proposed Landfill Removal Project. That effort may be able to give adequate assurance of the safety of the bluff.

As a further precaution, we recommend that a survey monitoring point be set in each gun pit and on each apron west of the parapet. The monitoring points should be initialized for both vertical and horizontal position. Points should be set before the start of construction, and ideally would be set some months before the start of construction to allow for more than one baseline reading, and to look for any on-going movement not associated with the construction. During construction, monitoring points should be read every two weeks whenever work is performed in the area. This work should be performed by a licensed Land Surveyor with a reading precision of 0.001 feet.

4 CONDITION SUMMARY

The following conditions were noted which could affect or be affected by the proposed construction:

- Cracking noted at Magazine 21 (see Section 2.5.2). This could be indicative of previous or on-going ground movement in the area.
- Cracking at Battery Boutelle (see Section 3). This could be indicative of previous or on-going ground movement in the area.
- Spalling at splinterproofs, tower, and deck extensions at Batteries Godfrey and Marcus Miller. Vibration from heavy equipment traffic and construction operations could result in loose concrete falling off. See below for a discussion of failure and falling hazards.

4.1 FAILURE HAZARDS

Failure hazards are conditions that could result in partial or complete collapse of a structural element, (beam, column or supported slab), under normal usage such as heavy visitor traffic. The following table lists the conditions that are considered failure hazards. It should be noted that the overall poor condition of the splinterproofs and deck extensions could also result in more wide spread element failure under seismic loading.

Failure Hazards

4.2 FALLING HAZARDS

Falling hazards are conditions that could present a life-safety hazard for visitors to the batteries. In all cases the hazard noted is loose concrete pieces in members such as beams, columns or slab soffits where rusting reinforcing is swelling and causing the concrete cover to spall off. Pieces that are likely to fall off are generally small, but could cause injury. The following table lists the conditions that are considered falling hazards:

5 RECOMMENDATIONS

5.1 GENERAL

Although serious structural concerns are few, weathering, neglect, vegetative growth and heavy visitor traffic continue to erode the exposed surfaces of the fortifications. The elements in greatest need of stabilization are the beams, columns and supported slabs of the splinterproofs and deck extensions. The

mass concrete elements, although substantially cracked and spalled, are less subject to continuing damage due to the lack of steel reinforcement.

If preservation and continued use of these historic fortifications as an interpretive site is anticipated, stabilization work should begin soon. This report, which documents 936 existing damage conditions could serve as a starting point to identify the scale of such stabilization.

5.1.1 Public Safety

Although not specifically part of the scope of this assessment, we have noted areas where the condition of the fortifications structure is such that it presents a potential hazard to the public when visiting the site. Potential structural failure hazards and hazards related to falling concrete pieces are discussed above.

One other typical and widespread condition that could present a hazard to the public is the condition and general lack of guard rails at deck edges and other abrupt drop offs. The photo below, taken at Gun Pit #2 at Battery Marcus Miller illustrates this potential hazard. In the photo it can be seen that the edge of the lowered gun pit is unprotected, as is the steel stair, stair landing, and the edge of the raised deck and deck extension. In addition, the checker plate at the stair landing is in very poor condition and is missing entirely after the end of the short landing.

PHOTO 758

5.1.2 Protection During Construction

Absent any geotechnical instability of the coastal bluffs, the proposed construction should not affect the structural integrity of the fortifications. Construction materials, equipment, and personnel should be kept away from the fortifications unless specific protection elements are installed (see below for a discussion of protection at Battery Marcus Miller.

We propose that the following measures be put in place for the construction period:

- Survey monitoring at Battery Boutelle as described in Section 4.

- Crack gauges should be installed across the existing major cracks in Magazine 21 (see Section 2.5.2). These small plastic gages are secured across the crack, and can be read visually to determine whether continuing movement is occurring.
- Splinterproofs, the tower at Battery Marcus Miller, and the areas below the deck extensions should be barricaded to protect the public from falling hazards.

5.2 BATTERY MARCUS MILLER

We understand that it is anticipated that the construction contractor may need to bring materials and equipment across the apron at Gun Pit #1. Because of the mass concrete of the magazine area below this apron and the narrow room dimensions, equipment of to 10,000 pounds can be safely supported above the apron.

However, it is not known whether the surface apron concrete is monolithic with the mass concrete below, whether it is separate from but bearing directly on the mass concrete, or whether there is a layer of soil between the top of the mass concrete and the bottom of the apron concrete. If there is a soil layer beneath a thin concrete surface, material handling equipment could cause damage to the apron itself.

We recommend that 2 to 3 inch diameter cores be drilled through the apron concrete in the proposed path of travel of such equipment to verify the existing construction. If monolithic construction is verified, or if the apron concrete appears to bear on the mass concrete below, then material handling equipment may pass over the apron, with appropriate surface protection. Surface protection should include a thin layer of soft material such a foam rubber carpet mat, covered with 3x12 rough cut Douglas Fir planks laid flat, secured with a continuous layer of ¾ inch plywood.

If a soil layer is discovered beneath the apron concrete, the protection along the path of travel should use 12x12 timber mats such as are used for crane stability in soft soils.

No materials or equipment should be stored, supported, or walked across the roofs of splinterproofs or the supported slabs of the deck extension. If it is desired to support a conveyor on any of these locations, wood or steel shoring posts should be installed immediately below the slab area, sized to carry 100% of the load to the foundation slab below.

6 NEXT STEPS

6.1 DURING CONSTRUCTION

This report will serve as the baseline for visual observations that will be taken during the construction. The survey team will compare the field conditions with the photos in the report. Changed conditions will be noted and evaluated, and any required change in construction operations will be recommended. Since the air quality in the enclosed spaces was confirmed to be adequate in this investigation, no air monitoring will be used.

Reports of the assessment during construction will be brief and focused on changed conditions only.

We will also read the crack gauges proposed to be installed in Magazine 21, review the survey monitoring reports, and make any recommendations for action.

6.2 AFTER CONSTRUCTION

At the completion of construction, we will again make a visual inspection of the batteries and prepare a brief final report outlining any changed conditions.

APPENDIX G

GEOPHYSICAL MAPPING

APPENDIX G
GEOPHYSICAL MAPPING

Introduction

Previous investigation reports (*Dames & Moore, 1997*), which included an examination of aerial photographs spanning 1946 to 1986, and recent on-site visual inspections have identified four "disturbed areas" where buried refuse is indicated. The disturbed areas lie along the approximately 1,600-foot "Lincoln Bluff" area north of Baker Beach. The disturbed areas are characterized by hummocky terrain and partially buried refuse, including concrete rubble, rusted metal objects, and pockets of broken glass. The purpose of the geophysical investigation was to more fully assess the extent of refuse in the four disturbed areas, which are designated BBDA-1, BBDA-1A, BBDA-2, and BBDA-2A (Plate G-1), prior to developing a subsurface investigation program. In addition, a preliminary estimate of refuse quality was developed.

MACTEC performed a geophysical investigation comprised an electromagnetic (EM) terrain conductivity survey to search for zones of anomalous conductivity indicative of buried refuse. The EM survey was augmented by a global positioning system (GPS) survey to map areas of exposed refuse. EM data were collected with a Geonics EM31-D terrain conductivity meter connected to a Polycorder 720 digital data logger. Mapping of the exposed refuse was performed with a Trimble Pro-XRS GPS. The GPS also provided positioning data for the EM survey. After an initial site visit by the geophysicist on February 6, 2003, the bulk of the field work was performed on March 25, 26, and 27, 2003. This investigation was briefly described previously in the *Interim Data Report* (*MACTEC, 2003b*), and has been updated in this Field Investigation Report Appendix G below.

Electromagnetic (EM) Method

The EM method measures electrical conductivity by means of an applied electromagnetic field. The applied field causes (induces) electric currents to flow in subsurface materials. The strength of the induced current, which is measured by the EM instrument's receiver, is directly proportional to the electrical conductivity of the subsurface material. Buried refuse conducts electricity differently than the surrounding soil, and is thus indicated by anomalous conductivity readings.

Metal objects, in particular, are readily detected by the EM method because they are highly conductive compared to soil and rock and therefore produce high-amplitude EM anomalies. Domestic waste in landfill trenches is also readily detected with the EM method because decaying refuse and the associated leachate are usually more conductive than the surrounding soil. Buried construction debris (e.g., concrete, wood, brick) with little or no metal can be difficult to detect because the electrical properties of such are similar to those of soil and rock. Such debris usually produces a low-amplitude EM anomaly that is apparent only if the debris is present in quantities sufficient to displace a large volume of native soil. In general, small, isolated pockets of non-metallic refuse are difficult targets for a geophysical survey.

The EM31-D instrument used for the Baker Beach investigation consists of transmitter and receiver coils mounted on each end of a 10-foot long PVC boom; the EM31-D can measure electrical conductivity to a depth of approximately 15 feet bgs.

Field Procedures

The MACTEC geophysicist first visited the Baker Beach site to inspect the disturbed areas and establish transect locations for the EM survey. The geophysicist was accompanied by George Ford and Russell Tom of the Presidio Trust, and Tim Doherty and Laura Castellini of the National Park Service. Because of the difficult site conditions, which included steep slopes, thick vegetation, and sensitive plant species, it was agreed that the EM survey lines should be confined to maintained hiking trails, unimproved "social trails," and a limited number of transects cut through the vegetation. The geophysicist used flagging tape to mark 11 alignments through the more densely vegetated portions of Areas 1, 1A, and 2. A Presidio Trust work crew then cut shoulder-width pathways along those alignments to permit passage of the geophysicist carrying the EM survey system.

Terrain conductivity data were collected by hand-carrying the EM survey system along "meandering path" transects with an approximately 1,600- by 300-foot area (Plate G-1). The EM system collected data at 0.5-second intervals, which corresponded to a reading approximately every 2 feet. In total, approximately 31,600 line-feet, or nearly 6 miles were surveyed.

Following the EM survey, the geophysicist performed a GPS mapping survey to augment the EM conductivity data. GPS was used to map the locations of exposed debris areas and individual refuse items observed on the ground surface. Where necessary, the geophysicist used a mattock (small pick) to examine the shallow subsurface to identify areas of buried refuse. The GPS unit alone is much smaller and less cumbersome than the full EM survey system so the geophysicist was able to inspect portions of the site, particularly those with thick vegetation or steep slopes, that could not be reached with the EM system. Thus, the combined EM and GPS survey approach provided more extensive site coverage than the EM survey alone could.

Data Processing

EM and GPS data were downloaded in the field to a laptop computer as necessary (i.e., when data logger memory was full). Upon returning to the office the geophysicist used the software program DAT31W to combine the EM and GPS data into a single data file suitable for computer contouring (DAT31W operates by matching the time stamp attached to each EM and GPS data record). A color-filled contour map of terrain conductivity was produced using OASIS Montaj, a geophysical data analysis software package from GEOSOFT of Toronto, Canada. The GPS data were processed with Trimble Pathfinder Office software to produce a map of observed refuse locations. The EM contour map and refuse location map were then combined to facilitate assessment of refuse extents in the four disturbed areas.

Results

Plate G-1 shows the overall extent of refuse in the four disturbed areas, as interpreted from the EM and GPS mapping data. Disturbed area characteristics including lateral (area) and volumetric quantity estimates based on an assumed average refuse depth of 5 feet are summarized in Table 1, below. Plate G-1 also shows the locations of individual refuse items mapped with the GPS. The EM terrain conductivity data are presented on Plate G-2 as a color-filled contour map. Refuse-free areas (native soil and rock) are generally green to yellow in color while refuse generally appears as "hot" (red & pink) and "cool" (blue) colors, indicative of conductivity above and below, respectively, the background readings. The blue color usually indicates metal objects. For reasons discussed below, not all of the "hot" and "cool" colored areas on Plate G-2 are interpreted to contain refuse.

Background conductivity varies greatly across the site due to the wide variety of natural geologic conditions, which range from low-conductivity bedrock to thick soil with a high-conductivity signature

similar to that of refuse. In addition, buildings adjacent to the survey area also produced anomalous conductivity readings. Accordingly, some "hot" colored areas on Plate G-2 represent native soil conditions and some "cool color" anomalies are caused by metal structures. The background conductivity of geologic material ranged from a low of approximately 20 milliseimens per meter (mS/m) in rocky portions of the site to a high of 40 mS/m in the thick soil areas.

While metal areas are strongly evident on the EM conductivity map, certain types of refuse, notably concrete, brick, and glass, did not produce appreciable EM anomalies because they lacked sufficient conductivity contrast with the surrounding soil and rock. Such areas were delineated visually and mapped with the GPS.

The highest-amplitude EM anomalies on Plate G-2 are not associated with refuse but rather with structures at the top of the bluff, particularly Battery Boutelle and Battery Marcus Miller. It should also be noted that the high conductivity west of Battery Boutelle and Battery Marcus Miller is attributed to conductive soil and not to refuse. Conversely, it should also be noted that many portions of the interpreted refuse areas (e.g., most of Disturbed Area 2A) do not exhibit an anomalous EM response. As stated previously, this is for two reasons: 1) the refuse lacks electrical contrast with the surrounding native material. 2) the refuse area could not be surveyed with EM due to access limitations.

Table 1. Summary of Disturbed Area Characteristics

Disturbed Area	Extent	Observations	Estimated Refuse Volume (5-ft thickness assumed)
1	51,200 sq ft 1.17 acres	Greatest amount of refuse observed, including large exposed face of domestic refuse (glass & pottery). Roof slate, concrete rubble, brick, metal debris found along social trails. Large accumulation of refuse at base of slope; concrete & metal debris spills onto beach. Approx. 5-ft thick section of refuse exposed at toe of slope. Debris spilled onto beach not considered for refuse area estimate.	9,500 CY
1A	9,014 sq ft 0.20 acres	Chunks of "asphaltic concrete" (dark colored sandstone-like substance are only indication of "refuse").	1,670 CY

Disturbed Area	Extent	Observations	Estimated Refuse Volume (5-ft thickness assumed)
2	12,400 sq ft 0.28 acres	Partially buried concrete and metal debris observed along social trails, possibly sloughed from upslope structures. Eastern & southern boundaries blend into battery structures; refuse limits uncertain. Difficult to survey through dense vegetation.	2,300 CY
2A	28,000 sq ft 0.64 acres	Primarily wood debris (tree trunks) with concrete and minor metal. Exposed pocket of broken glass along southwest boundary indicates area's use for domestic refuse disposal. Debris spilled onto beach not considered for refuse area estimate.	5,190 CY

Notes:

Sq ft = square feet

Cy = cubic yard(s)

BEACH DEBRIS SURVEY

MACTEC

June 1, 2005

REPORT
BAKER BEACH DEBRIS AND SAND INVESTIGATION
DISTURBED AREAS 1 AND 2A
PRESIDO OF SAN FRANCISCO
SAN FRANCISCO, CALIFORNIA

MACTEC Project No. 57255 00121

INTRODUCTION

This report presents the findings of MACTEC Engineering and Consulting, Inc.'s (MACTEC) debris and sand investigation at the Baker Beach Disturbed Area sites 1 and 2A (Figure G-1). The investigation objective was to document the amount of debris on the beach and to assess fluctuations in the amount of beach sand in the debris areas. The debris of interest is derived from the old, inactive refuse disposal areas (landfills) on the slope above the beach. The investigation findings will be used to prepare a beach remediation plan and to estimate the level of earthwork required to remove the debris, if deemed necessary.

The two-part investigation included a survey of beach debris and a survey of the beach sand elevation. The beach debris survey entailed GPS mapping and photographic documentation of debris items. The sand survey entailed measuring ground (sand) surface elevations at 10-foot intervals along one transect in each survey area. The investigation was conducted over one year and comprised four survey events. The first survey was performed on February 19, 2004, the second on May 10, 2004, the third on September 14, 2004, and the fourth on January 28, 2005.

RESULTS

Beach Debris Survey

The beach debris is composed mainly of concrete blocks, with minor amounts of stone, brick, and metal. Most of the debris (approximately 90%) is located below Disturbed Area 1 (Figure G-2). The beach below Disturbed Area 2A contains only 5 concrete blocks and a few small metal items (Figure G-3). Combined, the two areas contain approximately 80 concrete blocks and perhaps a dozen metal items. Most of concrete blocks are well-rounded and measure 4 feet or less in the longest dimension. Perhaps 5 or 6 concrete items are significantly larger, the most notable being a slab in Area 1 measuring approximately 9' x 9' x 2' (Figure G-4, Photo-1 & Photo-2) and an approximately 4-foot tall concrete block in Area 2A (Figure G-4, Photo-3).

In both areas, the debris is concentrated near the toe of the slope where it is nestled amongst large boulders. Most of the debris at Disturbed Area 1 occurs within a 140-foot wide zone directly below the landfill, although several concrete blocks were also found scattered along the toe of the slope north of the main debris area. In addition to debris concentrated at the toe of the slope, isolated concrete blocks were found on the beach proper, up to 40 feet away from the toe. The debris concentrated at the toe of the slope remained in view at all times; however, sand movement during the year caused some of the outlying blocks to become buried at times.

The metal debris includes pieces of small-diameter pipe (~1.5" o.d.), motor vehicle engine and drivetrain parts, and an unidentified cylindrical object approximately 5 feet long (Figure G-4, Photo-4). Additionally and of particular note are two masses of "slag" – fused masses of iron, copper, brick and glass measuring approximately 2' x 2' x 1' (Figure G-4, Photo-5). MACTEC estimates beach debris volume to be approximately 70 CY.

Panoramic photographs of the debris Area 1 are presented on FiguresG-5 through G-8. Photographs of some of the more substantial beach debris items are presented on Figure G-4. MACTEC also took photographs of other smaller debris items; however, for the sake of brevity, the other photographs are not presented with this report. These other photographs will be gladly provided upon request, but it is MACTEC's opinion that the panoramic photographs included with this report provide sufficient detail to adequately characterize the debris areas.

Beach Sand Survey

The sand surface was found to fluctuate vertically a maximum of approximately 2.5 feet along the transects. Most of the sand movement occurred in Area 1, within a 25-foot wide band from 15 to 40 feet from the toe of the slope. The sand surface fluctuation was less than 1 foot along the Area 2A transect. In both areas, the change in sand surface elevation was minimal at the toe of the slope where most of the debris is located, which allowed debris there to remain in view for all survey events. The greatest sand fluctuation was associated with a beach scarp that formed in Area 1 for the September 14, 2004 survey event. Beach profiles showing sand surface elevations for each of the survey events are presented on Figure G-9.

MACTEC recognized that the sand surface did not rise or fall evenly across the entire beach in accordance with what was measured along each transect. MACTEC observed that beach scarps and cusps formed an uneven and changing sand surface that alternately buried and uncovered debris items, particularly within a 25-foot wide band located 15 to 40 feet from the toe of the slope.

FIELD PROCEDURES

Beach Debris Survey

During the first survey event on February 19, 2004, MACTEC mapped the distribution of beach debris using a Trimble Pro-XRS dGPS system. Additionally, MACTEC used the GPS to map the toe of the slope, the location of some of the larger rocks on the beach, and the location of several photograph points. Additionally, MACTEC took panoramic photographs of the debris areas and close-up photographs of the more substantial debris items. MACTEC processed the GPS data to prepare debris location maps. MACTEC used these maps on subsequent site visits to identify newly exposed debris items. Additionally, the maps facilitated a qualitative assessment of sand movement across the entire debris area by showing which debris items remained in view and which items had become buried.

Beach Sand Survey

MACTEC first established reference points at the toe of the slope in each of the two survey areas. The points were marked by a small dot of orange spray paint and by a large nail driven flush into the soft rock. Next, the reference point elevations were obtained by using a tripod-mounted survey level to measure the elevation difference between the reference points and nearby survey points established by Chaudhary & Associates (Points 517 and 512 for Areas 1 and 2A, respectively). MACTEC then extended a tape measure from each reference point to a location 80 feet across the beach to mark the survey transects along which the elevation measurements were to be made. MACTEC used GPS to map the transect location and also measured the transect's bearing using a Brunton compass.

MACTEC then measured the relative change in the ground surface elevation at 10-foot intervals along the transect using a survey rod and a laser leveling tool mounted at the reference point. Upon returning to the office MACTEC converted the elevation difference readings into absolute elevation (Presidio Lowest Low Water, PLLW) at each measurement station and prepared the elevation profiles shown on Figure G-9.

For the three subsequent survey events, MACTEC first located the nail marking the reference point and then extended a tape measure across the beach to reestablish the transect. A Brunton compass was used to position the transects along the proper bearing. Next, the laser leveling system was installed at the reference point and the relative changes in elevation along the transects were measured as before.

We trust this report provides the information required. We can be reached at (510) 628 3227 or at RWSmith@MACTEC.com if you have any questions or require additional information.

MERCHANT ROAD REALIGNMENT GEOTECHNICAL INVESTIGATIONS

MACTEC

May 25, 2005

57255 008

Mr. George Ford
The Presidio Trust
1750 Lincoln Boulevard
P.O. Box 29052
San Francisco, California 94129-0052

Merchant Road Realignment
Geotechnical Investigations
Baker Beach Disturbed Areas 1, 1A, 2, and 2A
Presidio of San Francisco, California

Dear Mr. Ford:

MACTEC Engineering & Consulting, Inc. (MACTEC) is pleased to submit the results of our geotechnical investigations to support design of the realignment of Merchant Road as part of the Baker Beach Disturbed Areas 1, 1A, 2 and 2A (BBDA 1, 2, 1A, and 2A) remedial design.

Background

As part of selected remediation action for the BBDA 1, 2, 1A, and 2A, portions of Merchant Road will be realigned in the vicinity of Battery Boutelle, as shown on the location map, Figure 1. The purpose of the investigations described in this letter are to obtain subsurface information for our geotechnical engineers and engineers with the Golden Gate Bridge and Transportation District (GGBTD) to support grading and pavement design. The realignment will include cuts and fills along a curved stretch of roadway between the existing Merchant Road and its intersection with Storey Avenue and Lincoln Boulevard. A paved parking lot for the GGBTD is planned along the western edge of Merchant Road, as shown on Figure 2. This report presents test pit logs, laboratory testing and the results of our infiltration studies for the new parking lot. A discussion of each of these tasks follows.

Exploratory Test Pits

As part of the realignment of Merchant Road, 3 exploratory test pits were excavated along the centerline of the realignment as shown on Plate 1. The test pit locations were marked in the field and surveyed with GPS. Nesting bird surveys were conducted and utility clearances obtained prior to excavation. The excavations were performed with a backhoe provided by EERG using a backhoe shared with the concurrent cultural resource work near Battery Boutelle. An additional test pit was excavated for an infiltration test as discussed later in this letter.

MACTEC Engineering and Consulting, Inc.
5341 Old Redwood Highway, Suite 300 • Petaluma, CA 94954
707-793-3800 • Fax: 707-793-3900

Excavation was completed on May 6, 2005. The test pits ranged in depth from 5 to 6 feet. The test pits were backfilled and wheelrolled with the backhoe equipment. The test pits were logged by our field geologist using the Unified Soil Classification System (USCS). The materials encountered are described on the test pit logs provided in Appendix A. Selected bulk samples were collected of subgrade soils for laboratory testing.

Laboratory Testing was performed by RGH Geotechnical of Santa Rosa on 2 bulk samples. The bulk samples included soils from Test Pit A and a combined sample from similar soil horizons in test pit B and C. Analysis included R-value in conformance with Caltrans test method 301. The results of the analysis are provided in Appendix B

Percolation Testing

A field infiltration test was performed at a location identified as IT-1 (see figure 1) to estimate infiltration rates for the subsurface materials at the test location. Testing was performed in general accordance with procedures for infiltration testing using ASTM Method D 3385-03, "Standard Test Method for Infiltration Rate of Soils in Field Using Double-Ring Infiltrometer." A description of the testing procedure and the results of the test are presented in Appendix B.

We trust that this letter meets your needs by describing the work and results of this investigation. We understand that the results of the infiltration test will be forwarded to the GGBTD via the NPS. If you have any questions, please call Michael Jacobvitz at (707) 793-3853

It has been a pleasure to be of professional service to you. Please call if you have any questions or if we can be of further assistance.

Sincerely,

MACTEC Engineering and Consulting Inc.

William Godwin
Senior Engineering Geologist CEG 2199

Michael Jacobvitz

APPENDIX B

Infiltration Test Results

Double-Ring Infiltrometer Test Procedure

At the infiltration test location site an 8" pad was cut then the inner and outer infiltrometer rings were driven using a backhoe. The inner and outer infiltrometer rings were driven 2 and 6 inches respectively. Separate water supplies were provided for the inner and outer infiltrometer rings in containers of known volume. The water source was from a nearby fire hydrant on Presidio Trust property. At the start of the test, water was introduced into the inner ring and annular space (outer ring). The water level was established at the same depth in both rings and was maintained at a constant level using float control valves throughout the test. The amount of water used from each container was measured and recorded at time intervals based on the observed infiltration rate.

The equipment for the infiltration test was set up on the morning of May 12, 2005, and the test started that afternoon at 1:03 pm. The infiltration test site was 17 feet upslope and south of the test pit location. The weather during the test was cool and windy with a west wind, clear skies at the start of the test but overcast by 5:00 pm that afternoon and throughout the remainder of the test. The container supplying the water to the inner ring was covered to minimize errors due to evaporation. The infiltration test concluded at 1:30 pm the following day on May 13, 2005.

Test Results

The results of the field test program are presented in Table 1 and Figure B-2 and are summarized below. The soil at the infiltration test site at the top of the cut pad (8" below ground surface) per the unified soil classification system ASTM D2488-93 is described as a mottled yellowish brown to dark grayish brown clayey sand (SC) 10YR 5/6 to 10YR 4/2, dry, very hard, 55% sand, 40% fines, and 5% gravel (fill). A backhoe was used the bucket to pound the inner and outer rings into the cut surface. Manually driving the rings with a sledgehammer was ineffective. A log of a test pit adjacent to the infiltration test is provided (Figure B-1). Infiltration rates in general were low and required long time intervals between readings.

CASE NARRATIVE

Laboratory number:	**178846**
Client:	**Mactec, Inc.**
Project:	**BAKER BEACH**
Location:	**Presidio/Baker Beach**
Request Date:	**04/12/05**
Samples Received:	**04/12/05**

This hardcopy data package contains sample and QC results for two soil samples, requested for the above referenced project on 04/12/05. The samples were received intact.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
High responses were observed for many analytes in the ICV analyzed 04/16/05 15:47; these analytes were not detected at or above the RL in the associated samples, and affected data was qualified with "b". No other analytical problems were encountered.

Metals (EPA 6020 and EPA 7471A):
Low recoveries were observed for many analytes in the MS/MSD of BB1ATP101-G2 (lab # 178846-002); the BS/BSD were within limits, and the associated RPDs were within limits. No other analytical problems were encountered.

Moisture (ASTM D2216/CLP):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**178951**
Client:	**Mactec, Inc.**
Project:	**BAKER BEACH**
Location:	**Presidio / Baker Beach**
Request Date:	**04/18/05**
Samples Received:	**04/18/05**

This hardcopy data package contains sample and QC results for four soil samples, requested for the above referenced project on 04/18/05. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
High responses were observed for bromomethane and Freon 113 in the CCV analyzed 04/20/05 16:26; these analytes were not detected at or above the RL in the associated samples. High response was observed for Freon 113 in the CCV analyzed 04/20/05 08:49; this analyte was not detected at or above the RL in the associated sample. High recoveries were observed for trichloroethene in the MS/MSD for batch 101317; the parent sample was not a project sample, the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples. High surrogate recoveries were observed for bromofluorobenzene in a number of samples. Methylene chloride was detected above the RL in BB2ATP100(1.0) (lab # 178951-002) and BB2ATP101(14.0) (lab # 178951-003); this analyte is a common laboratory contaminant. No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
High responses were observed for many analytes in the ICV analyzed 04/16/05 15:47; these analytes were not detected at or above the RL in the associated samples, and affected data was qualified with "b". No other analytical problems were encountered.

PCBs (EPA 8082):
High surrogate recoveries were observed for decachlorobiphenyl and TCMX in BB1TP102(4.0) (lab # 178951-004); no target analytes were detected in the sample. No other analytical problems were encountered.

Metals (EPA 6020 and EPA 7471A):
Low recoveries were observed for many analytes in the MS/MSD of BB1ATP101-G2 (lab # 178846-002); the BS/BSD were within limits, and the associated RPDs were within limits. High RPD was observed for mercury in the MS/MSD for batch 101291; the parent sample was not a project sample, and the RPD was acceptable in the BS/BSD. No other analytical problems were encountered.

Curtis & Tompkins, Ltd.

CASE NARRATIVE

Laboratory number:	**178951**
Client:	**Mactec, Inc.**
Project:	**BAKER BEACH**

Sand weighed out for QC samples	EM44256	JOM 21 Apr 05
Samples were dried with CH2Cl2-rinsed ~~granular~~ powdered Na2SO4	EM44135453 JOM 4/21/05	↓
1.0 mL of TEH_SURR surrogate solution was added to all samples	S253B/C*	
1.0 mL of TEH_SP matrix spiking solution was added to all spikes	S305C	
≥ 75 mL of 1+1 (CH_2Cl_2+Acetone) was added to all	CH_2Cl_2 EM45005	
	Acetone EM45019	
Samples were: ☐ sonicated 3 times ☒ placed on shaker table at:	0900	↓
taken off shaker table at:	1110	SHD 4/20/05
Extracts filtered through baked, rinsed powdered Na_2SO_4	EM44135453	↓
Concentrated to volumes as noted above	✓

PAH-SIM Results & QC Summary

Curtis & Tompkins, Ltd.

Semivolatile Organics by GC/MS SIM

Lab #:	178951	Location:	Presidio / Baker Beach
Client:	Mactec, Inc.	Prep:	EPA 3550B
Project#:	BAKER BEACH	Analysis:	EPA 8270C-SIM
Field ID:	BB2ATP104(8.0)	Batch#:	101384
Lab ID:	178951-001	Sampled:	04/13/05
Matrix:	Soil	Received:	04/18/05
Units:	ug/Kg	Prepared:	04/21/05
Basis:	dry	Analyzed:	04/22/05
Diln Fac:	20.00		

Moisture: 19%

Analyte	Result	RL	MDL
Naphthalene	41 J	120	29
Acenaphthylene	ND	120	32
Acenaphthene	ND	120	30
Fluorene	ND	120	28
Phenanthrene	ND	120	30
Anthracene	ND	120	51
Fluoranthene	ND	120	28
Pyrene	ND	120	25
Benzo(a)anthracene	ND	120	31
Chrysene	ND	120	24
Benzo(b)fluoranthene	62 J b	120	29
Benzo(k)fluoranthene	42 J	120	38
Benzo(a)pyrene	ND	120	48
Indeno(1,2,3-cd)pyrene	ND	120	29
Dibenz(a,h)anthracene	ND	120	29
Benzo(g,h,i)perylene	ND	120	29

Surrogate	%REC	Limits
Nitrobenzene-d5	84	37-140

CASE NARRATIVE

Analysis of Samples for the Presence of

Polychlorinated Dibenzo-p-dioxins and Dibenzofurans by

High-Resolution Chromatography / High-Resolution Mass Spectrometry

Method 8290 Rev. 0 (9/94)

Date:	May 3, 2005
Client ID:	Curtis & Tompkins
P.O. Number:	178951
Project Number:	64980

Eno River Labs, LLC has acquired the assets of Triangle Laboratories, Inc. and will continue its operations.

This report should only be reproduced in full. Any partial reproduction of this report requires written permission from Eno River Labs, LLC

Rev. 04/12/04

Overview

The sample and associated QC samples were extracted and analyzed according to procedures described in EPA Method 8290 Rev. 0 (9/94). Any particular difficulties encountered during sample handling will be discussed in the QC Remarks section below. This report contains results from only the 8290 dioxin/furan analysis of the soil sample.

Quality Control Samples

A laboratory method blank was prepared along with each batch of samples.

A laboratory control spike (LCS) sample was extracted and analyzed along with the sample. A report summarizing the analyte recoveries for this sample is included in the data package.

Matrix spike (MS) and matrix spike duplicate (MSD) samples were extracted and analyzed along with the samples. A report summarizing the analyte recoveries and relative percent differences for these samples is included in the data package.

Quality Control Remarks

This release of this particular set of Curtis & Tompkins analytical data by Eno River Labs, LLC was authorized by the Quality Control Chemist who has reviewed each sample data package following a series of inspections/reviews. When applicable, general deviations from acceptable QC requirements are identified below and comments are made on the effect of these deviations upon the validity and reliability of the results. Specific QC issues associated with this particular project are:

Sample receipt: One soil sample was received from Curtis & Tompkins at 6°C in good condition on April 19, 2005 and stored in a refrigerator at 4°C.

Sample Preparation Laboratory: None

Mass Spectrometry: None

Data Review: Several analyte recoveries in the MS and MSD and the associated relative percent differences (RPDs) are outside the QC limits. These variances are due to high levels of these analytes in the native sample. When the amount in the native sample approaches more than one-forth the spiked analyte level, statistical analysis becomes unreliable and percent recoveries and RPDs can not be assessed using the QC samples.

Other Comments: No 2,3,7,8-substituted target analytes were detected in the laboratory blank above the target detection limit (TDL).

Method 8290 contains separate criteria for beginning and ending continuing calibrations. When the ending calibration meets criteria established for the beginning calibration, the average response factor from the initial calibration is used. When the ending calibration only meets the less stringent criteria specified for an ending calibration, the average of the response factor from the beginning and ending calibration is used for analyte and internal standard calculations. Affected samples are identified by the listing of both the beginning and ending calibration filename on the sample report.

EMPC stands for **E**stimated **M**aximum **P**ossible **C**oncentration. A dioxin or furan analyte is quantitated as an EMPC when the detected analyte meets the retention time criteria of a dioxin or furan, but not the isotopic ratio criteria. Interferences, such as PCBs, may co-elute or cause quantitative interference, causing a peak ratio to be outside criteria. Low level peaks that are close to the detection limits can be significantly affected by instrument and chemical noise, causing the ratio to be outside criteria. As a result, the reported value(s) should be considered estimated at the highest level possible.

The analytical results presented in this report are consistent with the guidelines of EPA Method 8290 Rev. 0 (9/94). Any exceptions have been discussed in the QC Remarks section of this case narrative with emphasis on their effect on the results. Should Curtis & Tompkins have any questions or comments regarding this data package, please feel free to contact our customer service at (919) 281-4013.

The total number of pages in the data package is : _____ .

Method 8290 Sample Calculations:

Analyte Concentration

The concentration or amount of any analyte is calculated using the following expression.

$$C_{(\sigma)} = \frac{A_\sigma * Q_\beta}{A_\beta * RRF_{(\sigma)} * W}$$

Where:

$C_{(\sigma)}$	=	concentration or amount of a given analyte
A_σ	=	integrated current for the characteristic ions of the analyte
A_β	=	integrated current of the characteristic ions of the corresponding internal standard
Q_β	=	amount of internal standard added to the sample before extraction
$RRF_{(\sigma)}$	=	mean analyte relative response factor from the initial calibration
W	=	sample weight or volume

Detection Limits

The detection limit reported for a target analyte that is not detected or presents an analyte response that is less than 2.5 times the background level is calculated by using the following expression. The area of the analyte is replaced by the noise level measured in a region of the chromatogram clear of genuine GC signals. The detection limits represent the maximum possible concentration of a target analyte that could be present without being detected.

$$DL_{(\sigma)} = \frac{2.5 * H * Q_\beta}{H_\beta * RRF_{(\sigma)} * W}$$

Where:

$DL_{(\sigma)}$	=	estimated detection limit for a target analyte
2.5	=	minimum response required for a GC signal
H	=	sum heights of the noise
H_β	=	sum of peak heights of the characteristic ions of the corresponding internal standard
Q_β	=	amount of internal standard added to the sample before extraction
$RRF_{(\sigma)}$	=	mean analyte relative response factor from the initial calibration
W	=	sample weight or volume

Data Flags

In order to assist with data interpretation, data qualifier flags are used on the final reports. Please note that all data qualifier flags are subjective and are applied as consistently as possible. Each flag has been reviewed by two independent Chemists and the impact of the data qualifier flag on the quality of the data discussed above. The most commonly used flags are:

A **'B'** flag is used to indicate that an analyte has been detected in the laboratory method blank as well as in an associated field sample. The 'B' flag is used only when the amount of analyte found in the sample is less than 20 times that found in the associated blank. This flag denotes possible contribution of background laboratory contamination to the concentration or amount of that analyte detected in the field sample.

An **'E'** flag is used to indicate a concentration based on an analyte to internal standard ratio which exceeds the range of the calibration curve. Values which are outside the calibration curve are estimates only.

An **'I'** flag is used to indicate labeled standards have been interfered with on the GC column by coeluting, interferent peaks. The interference may have caused the standard's area to be overestimated. All quantitations relative to this standard, therefore, may be underestimated.

A **'J'** flag is used to indicate a concentration based on an analyte to internal standard ratio which is below the calibration curve. Values which are outside the calibration curve are estimates only.

A **'PR'** flag is used to indicate that a GC peak is poorly resolved. This resolution problem may be seen as two closely eluting peaks without a reasonable valley between the peak tops, overly broad peaks, or peaks whose shapes vary greatly from a normal distribution. The concentrations or amounts reported for such peaks are most likely overestimated.

A **'Q'** flag is used to indicate the presence of QC ion instabilities caused by quantitative interferences.

An **'RO'** flag is used to indicate that a labeled standard has an ion abundance ratio that is outside of the acceptable QC limits, most likely due to a coeluting interference. This may have caused the percent recovery of the standard to be overestimated. All quantitations versus this standard, therefore, may be underestimated.

An **'S'** flag indicates that the response of a specific PCDD/PCDF isomer has exceeded the normal dynamic range of the mass spectrometer detection system. The corresponding signal is saturated and the reported analyte concentration is a 'minimum estimate'. When

the 'S' qualifier is used in the reporting of 'totals', there is saturation of one (not necessarily from a specific isomer) or more saturated signals for a given class of compounds. Results for saturated analytes are reported as greater than the upper calibration limit.

A **'U'** flag is used to indicate that a specific isomer cannot be resolved from a large, co-eluting interferent GC peak. The specific isomer is reported as not detected as a valid concentration cannot be determined. The calculated detection limit, therefore, should be considered an underestimated value.

A **'V'** flag is used to indicate that, although the percent recovery of a labeled standard may be below a specific QC limit, the signal-to-noise ratio of the peak is greater than ten-to-one. The standard is considered reliably quantifiable. All quantitations derived from the standard are considered valid as well.

An **'X'** flag is used to indicate that a polychlorodibenzofuran (PCDF) peak has eluted at the same time as the associated diphenyl ether (DPE) and that the DPE peak intensity is at least ten percent of the total PCDF peak intensity. Total PCDF values are flagged 'X' if the total DPE contribution to the total PCDF value is greater than ten percent. All PCDF peaks that are significantly influenced by the presence of DPE peaks are either reported as "estimated maximum possible concentration (EMPC) values without regard to the isotopic abundance ratio, or are included in the detection limit value depending on the analytical method.

Clinical Laboratory Improvement Amendments (CLIA) Registration. ID # 34D0705123. Department of Health & Human Services, Health Care Financing Administration. Certificate for the Acceptance of Human Specimens for the purposes of performing laboratory examinations or procedures - Chemistry, Toxicology, HCFA. Expires May 30, 2005.

U.S. Dept of Justice, Drug Enforcement Agency (DEA). Registration number RE0317811. Controlled substance registration for schedules 1,2,3,3N,4,5. Expires 8/31/05.

N.C. Department of Health and Human Services. Registration number NC-PE 0000 2493. North Carolina controlled substances registration for schedules 1, 2, 2N, 3, 3N, 4, 5, 6. Expires 10/31/2005.

Food & Drug Administration (FDA) Registration. ID #'s 001500 3004570112. Annual registration of drug establishment.

OTHER

U.S. Department of Agriculture Soil Permit. Permit No. S-68701. Under the authority of the Federal Plant Pest Act, permission is granted to receive foreign soil samples for use in laboratory analysis. Expires September 30, 2009.

U.S. EPA Large Quantity Hazardous Waste Generator. EPA ID #NCR000137232. Permit indicates that the laboratory is a large generator of hazardous waste. No expiration date.

U.S. Fish and Wildlife Permit. Number LE027890-1. Authorization to import/export wildlife and/or wildlife products. Expires April 30, 2005.

2445 S. Alston Avenue, Durham NC 27713 ◎ 919-281-4040 ◎ FAX 919-281-4070 ◎ www.enoriverlabs.com

Initial ....Date...

Data Review By: PAB 5/3/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside ratio limits has been recalculated according to method requirements.

Initial ....Date...

Data Review By: PaB 5/3/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside ratio limits has been recalculated according to method requirements.

Initial ....Date...

Data Review By: PAB 4/29/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside ratio limits has been recalculated according to method requirements.

CASE NARRATIVE

Laboratory number:	**179049**
Client:	**Mactec, Inc.**
Project:	**57255 001 22**
Location:	**Presidio / Baker Beach**
Request Date:	**04/22/05**
Samples Received:	**04/22/05**

This hardcopy data package contains sample and QC results for one soil sample, requested for the above referenced project on 04/22/05. The sample was received on ice and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
Gasoline C7-C12 was detected between the MDL and the RL in the method blank for batch 101391; this analyte was not detected in the sample at or above the RL. No other analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
Response exceeding the instrument's linear range was observed for diesel C10-C24 in the MS for batch 101505. Parent sample was not from this site. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
Low response was observed for bromomethane in the ICV analyzed 03/30/05 21:59; this analyte was not detected at or above the RL in the associated samples. High response was observed for Freon 12 in the CCV analyzed 04/22/05 11:19; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
High responses were observed for many analytes in the ICV analyzed 04/16/05 15:47; these analytes were not detected at or above the RL in the associated samples. Low response was observed for benzo(k)fluoranthene in the CCV analyzed 04/26/05 19:00; this analyte met minimum response criteria. BBITP106(5.0) (lab # 179049-001) was diluted due to high levels of non-target analytes and the dark, viscous nature of the sample extract. No other analytical problems were encountered.

PCBs (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6020 and EPA 7471A):
Low recoveries were observed for copper and zinc in the MS/MSD for batch 101496; the parent sample was not a project sample, and the BS/BSD were within limits. Recoveries were low for these elements in the post digestion spike. No other analytical problems were encountered.

Moisture (ASTM D2216/CLP):
No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 179049 Date Received: 4-22-05 Number of Coolers: 1
Client: Mactec Project: Presidio / Baker Beach

A. Preliminary Examination Phase
Date Opened: 4-22-05 By (print): Troy Windsor (sign) Troy Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... YES NO
   Type of ice: Wet Temperature: Cold - no temp blank

B. Login Phase
Date Logged In: 4-22-05 By (print): Troy Windsor (sign) Troy Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

Sand weighed out for QC samples	EM44258	SHD 4/27/05
Samples were dried with CH_2Cl_2-rinsed ~~granular~~ powder Na_2SO_4	EM44135453	
1.0 mL of TEH_SURR surrogate solution was added to all samples	S253B	
1.0 mL of TEH_SP matrix spiking solution was added to all spikes	S305A	
≥ 75 mL of 1+1 (CH_2Cl_2+Acetone) was added to all	CH_2Cl_2 45005	
	Acetone 44233	
Samples were: ☐ sonicated 3 times ☑ placed on shaker table at:	0900	
taken off shaker table at:	1100	
Extracts filtered through baked, rinsed powdered Na_2SO_4	EM44135453	
Concentrated to volumes as noted above	✓

Sand weighed out for QC samples	EM44258	JOM 26Apr05
dried with CH_2Cl_2-rinsed ☐ granular Na_2SO_4 ☒ diatomaceous earth	Donex 040603	
0.020 mL of surrogate solution was added to all samples	S258B	
0.025 mL of spike solution AR1242 was added to all spikes	S284A	
1:1 CH_2Cl_2 (lot# EM45005):Acetone(lot# EM45019) was added to all	✓	
☐ sonicated 3 times w/ ≥100mL ☒ PFE extracted ☐ soxhlet extracted	✓	
ASE Cellulose Filters used:	Whatman D28	
PFE (ASE) / soxhlets on at:	N/A	
PFE (ASE) / soxhlets off at:		
Extracts filtered through baked, CH_2Cl_2-rinsed granular Na_2SO_4	↓	
Concentrated to volumes noted above after exchange to Hexane Lot#	CN801	
EPA 3665A Clean-up: vortexed w/ 10mL H_2SO_4 Lot#	JTBA49034	
Centrifuged for 1 min; 10mL transferred to labelled vial	✓	↓

WOULDN'T CONCENTRATE

	Mfg & Lot # / LIMS # / Time	Date/Initials
Sand weighed out for QC samples	FSN 49258	BS 4/26/05
Samples were dried with baked, CH_2Cl_2-rinsed granular Na_2SO_4	FSN 4913545 3	
1.0 mL of surrogate solution was added to all samples	5369A	
1.0 ~~2.0~~ 1.0 mL of matrix spiking solution was added to all spikes 5369 BS/MS	5212C 5368A	
≥100mL 1:1 CH_2Cl_2:Acetone was added to all: CH_2Cl_2	FSN 45005	
Acetone	FSN 45019	
Samples were: ☑ sonicated 3 times ☐ soxhlet extractors on at:		
soxhlets off at:	NA	
Extracts filtered through baked, CH_2Cl_2-rinsed powdered Na_2SO_4	FSN 4913545 3	
Concentrated: ☑ to volumes as noted above ☐ to clean-up volume	J	
Clean-up (if necessary): ☐ GPC (see GPC run log) ☐ Silica Gel	NA	
Concentrated to final volumes as noted above	J

CASE NARRATIVE

Analysis of Samples for the Presence of

Polychlorinated Dibenzo-p-dioxins and Dibenzofurans by

High-Resolution Chromatography / High-Resolution Mass Spectrometry

Method 8290 Rev. 0 (9/94)

Date:	May 17, 2005
Client ID:	Curtis & Tompkins
P.O. Number:	179049
Project Number:	65028

Eno River Labs, LLC has acquired the assets of Triangle Laboratories, Inc. and will continue its operations.

This report should only be reproduced in full. Any partial reproduction of this report requires written permission from Eno River Labs, LLC

Rev. 04/12/04

Overview

The sample and associated QC samples were extracted and analyzed according to procedures described in EPA Method 8290 Rev. 0 (9/94). Any particular difficulties encountered during sample handling will be discussed in the QC Remarks section below. This report contains results from only the 8290 dioxin/furan analysis of one soil sample.

Quality Control Samples

A laboratory method blank was prepared along with each batch of samples.

A laboratory control spike (LCS) sample was extracted and analyzed along with the sample. A report summarizing the analyte recoveries for this sample is included in the data package.

Matrix spike (MS) and matrix spike duplicate (MSD) samples were extracted and analyzed along with the samples. A report summarizing the analyte recoveries and relative percent differences for these samples is included in the data package.

Quality Control Remarks

This release of this particular set of Curtis & Tompkins analytical data by Eno River Labs, LLC was authorized by the Quality Control Chemist who has reviewed each sample data package following a series of inspections/reviews. When applicable, general deviations from acceptable QC requirements are identified below and comments are made on the effect of these deviations upon the validity and reliability of the results. Specific QC issues associated with this particular project are:

Sample receipt: One soil sample was received from Curtis & Tompkins at 4°C in good condition on April 23, 2005 and stored in a refrigerator at 4°C.

Sample Preparation Laboratory: None

Mass Spectrometry: None

Data Review: The OCDD concentration in the field sample is above the calibration range. The affected analyte is flagged with an "E" qualifier. The client was notified and authorized dilution of the sample. The sample was diluted by adding additional internal standard to obtain an analyte response that is within the calibration curve. As the results are not recovery corrected. Only those analytes that exceeded the calibration range are reported on the diluted analysis.

Other Comments: No 2,3,7,8-substituted target analytes were detected in the laboratory blank above the target detection limit (TDL).

EMPC stands for **E**stimated **M**aximum **P**ossible **C**oncentration. A dioxin or furan analyte is quantitated as an EMPC when the detected analyte meets the retention time criteria of a dioxin or furan, but not the isotopic ratio criteria. Interferences, such as PCBs, may co-elute or cause quantitative interference, causing a peak ratio to be outside criteria. Low level peaks that are close to the detection limits can be significantly affected by instrument and chemical noise, causing the ratio to be outside criteria. As a result, the reported value(s) should be considered estimated at the highest level possible.

The analytical results presented in this report are consistent with the guidelines of EPA Method 8290 Rev. 0 (9/94). Any exceptions have been discussed in the QC Remarks section of this case narrative with emphasis on their effect on the results. Should Curtis & Tompkins have any questions or comments regarding this data package, please feel free to contact our customer service at (919) 281-4013.

Released by,

Kenneth Varley

Report Preparation Chemist
Eno River Labs, LLC

The total number of pages in the data package is : _____ .

Method 8290 Sample Calculations:

Analyte Concentration

The concentration or amount of any analyte is calculated using the following expression.

$$C_{(\sigma)} = \frac{A_\sigma * Q_\beta}{A_\beta * RRF_{(\sigma)} * W}$$

Where:

$C_{(\sigma)}$	=	concentration or amount of a given analyte
A_σ	=	integrated current for the characteristic ions of the analyte
A_β	=	integrated current of the characteristic ions of the corresponding internal standard
Q_β	=	amount of internal standard added to the sample before extraction
$RRF_{(\sigma)}$	=	mean analyte relative response factor from the initial calibration
W	=	sample weight or volume

Detection Limits

The detection limit reported for a target analyte that is not detected or presents an analyte response that is less than 2.5 times the background level is calculated by using the following expression. The area of the analyte is replaced by the noise level measured in a region of the chromatogram clear of genuine GC signals. The detection limits represent the maximum possible concentration of a target analyte that could be present without being detected.

$$DL_{(\sigma)} = \frac{2.5 * H * Q_\beta}{H_\beta * RRF_{(\sigma)} * W}$$

Where:

$DL_{(\sigma)}$	=	estimated detection limit for a target analyte
2.5	=	minimum response required for a GC signal
H	=	sum heights of the noise
H_β	=	sum of peak heights of the characteristic ions of the corresponding internal standard
Q_β	=	amount of internal standard added to the sample before extraction
$RRF_{(\sigma)}$	=	mean analyte relative response factor from the initial calibration
W	=	sample weight or volume

Data Flags

In order to assist with data interpretation, data qualifier flags are used on the final reports. Please note that all data qualifier flags are subjective and are applied as consistently as possible. Each flag has been reviewed by two independent Chemists and the impact of the data qualifier flag on the quality of the data discussed above. The most commonly used flags are:

A **'B'** flag is used to indicate that an analyte has been detected in the laboratory method blank as well as in an associated field sample. The 'B' flag is used only when the amount of analyte found in the sample is less than 20 times that found in the associated blank. This flag denotes possible contribution of background laboratory contamination to the concentration or amount of that analyte detected in the field sample.

An **'E'** flag is used to indicate a concentration based on an analyte to internal standard ratio which exceeds the range of the calibration curve. Values which are outside the calibration curve are estimates only.

An **'I'** flag is used to indicate labeled standards have been interfered with on the GC column by coeluting, interferent peaks. The interference may have caused the standard's area to be overestimated. All quantitations relative to this standard, therefore, may be underestimated.

A **'J'** flag is used to indicate a concentration based on an analyte to internal standard ratio which is below the calibration curve. Values which are outside the calibration curve are estimates only.

A **'PR'** flag is used to indicate that a GC peak is poorly resolved. This resolution problem may be seen as two closely eluting peaks without a reasonable valley between the peak tops, overly broad peaks, or peaks whose shapes vary greatly from a normal distribution. The concentrations or amounts reported for such peaks are most likely overestimated.

A **'Q'** flag is used to indicate the presence of QC ion instabilities caused by quantitative interferences.

An **'RO'** flag is used to indicate that a labeled standard has an ion abundance ratio that is outside of the acceptable QC limits, most likely due to a coeluting interference. This may have caused the percent recovery of the standard to be overestimated. All quantitations versus this standard, therefore, may be underestimated.

An **'S'** flag indicates that the response of a specific PCDD/PCDF isomer has exceeded the normal dynamic range of the mass spectrometer detection system. The corresponding signal is saturated and the reported analyte concentration is a 'minimum estimate'. When the 'S' qualifier is used in the reporting of 'totals', there is saturation of one (not

necessarily from a specific isomer) or more saturated signals for a given class of compounds. Results for saturated analytes are reported as greater than the upper calibration limit.

A **'U'** flag is used to indicate that a specific isomer cannot be resolved from a large, co-eluting interferent GC peak. The specific isomer is reported as not detected as a valid concentration cannot be determined. The calculated detection limit, therefore, should be considered an underestimated value.

A **'V'** flag is used to indicate that, although the percent recovery of a labeled standard may be below a specific QC limit, the signal-to-noise ratio of the peak is greater than ten-to-one. The standard is considered reliably quantifiable. All quantitations derived from the standard are considered valid as well.

An **'X'** flag is used to indicate that a polychlorodibenzofuran (PCDF) peak has eluted at the same time as the associated diphenyl ether (DPE) and that the DPE peak intensity is at least ten percent of the total PCDF peak intensity. Total PCDF values are flagged 'X' if the total DPE contribution to the total PCDF value is greater than ten percent. All PCDF peaks that are significantly influenced by the presence of DPE peaks are either reported as "estimated maximum possible concentration (EMPC) values without regard to the isotopic abundance ratio, or are included in the detection limit value depending on the analytical method.

Secondary NELAP Certificate: Illinois Environmental Protection Agency. Accreditation Number #200007, Certificate #001168; Drinking Water, Method 1613, 2,3,7,8-TCDD; Wastewater, Organic, Methods 1613; Hazardous and Solid Waste, Organic, Methods 8280A and 8290. Expires 30 September 2005.

Indiana Department of Health. Dioxin in drinking water, EPA method 1613. Lab ID # C-NC-01. Expires July 31, 2005.

Secondary NELAP Certificate: State of Kansas. Certificate # E-10215. Drinking Water, Method 1613, 2,3,7,8-TCDD; Wastewater, Methods 1613; Hazardous and Solid Waste, Methods 8280A and 8290. Expires July 31, 2005.

Commonwealth of Kentucky, Department for Environmental Protection. Lab ID #90060. 2,3,7,8 TCDD (Dioxin) in drinking water. Expires December 31, 2005.

Secondary NELAP Certificate: State of Louisiana Department of Environmental Quality. Certificate # 01979. CAA, TO-9A and TO-13A; **CWA**, Method 1613 PCDDs/PCDFs; **RCRA**, Methods 8280A & 8290 PCDDs/PCDFs; Misc. Methods 1613, 8280A & 8290. Expires 30 June 2005.

Secondary NELAP Certificate: State of Louisiana Department of Health & Hospitals. Certificate # LA040020. SDWA, Dioxin (2,3,7,8-TCDD) in Drinking Water. Expires December 31, 2005.

Maine Department of Human Services. Certification #: NC140. SDWA, Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water; **CWA**, Method 1613, PCDD/PCDF. Expires May 30, 2005.

2445 S. Alston Avenue, Durham NC 27713 ◎ 919-281-4040 ◎ FAX 919-281-4070 ◎ www.enoriverlabs.com

Maryland Department of Health and Mental Hygiene. Certification # 235, SOC 2 (Dioxin). Expires September 30, 2005.

Commonwealth of Massachusetts, Department of Environmental Protection, does not require Certification for Drinking Water Dioxin/Furan analysis.

State of Michigan, Department of Environmental Quality. SDWA; 2,3,7,8 TCDD by Method 1613. Expires July 31, 2005.

Minnesota Department of Health. The certification program in MN does not include dioxins/furans for CWA, SDWA of RCRA. See U.S. EPA Region V.

Mississippi State Department of Health. Dioxin in drinking water. No expiration date.

State of Montana Department of Public Health and Human Services. Dioxin in drinking water. December 31, 2004.

State of Nebraska Department of Health and Human Services. Reciprocal certification with the Florida DOH NELAP Certification. **SDWA,** Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water. Expires June 30, 2005.

State of Nevada, Division of Environmental Protection. Lab Certificate No. NC140-2004-75. SDWA, Method 1613B, 2,3,7,8-TCDD for Dioxin in Drinking Water; **CWA,** Method 1613B, expires July 31, 2005.

Primary NELAP Certificate: **State of New Jersey, Department of Environmental Protection, ID #NC010, CLC040001. CAA,** Methods 0023A and MM5 (Sampling Train). Secondary NELAP Certificate: **SDWA,** Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water; **CWA,** Method 1613, PCDD/PCDF & totals; **RCRA,** Method 8290, PCDD/PCDF & totals. Expires June 30, 2005.

State of New Mexico, Environment Department. Safe Drinking Water Act; 2,3,7,8-TCDD by Method 1613. Expires June 30, 2005.

Secondary NELAP Certificate: New York State Department of Health, LAB ID #11026. Potable Water, 2,3,7,8-TCDD, EPA 1613, Serial # 26053; **Non-Potable Water,** 2,3,7,8-TCDD, EPA 1613, Serial # 26054. Expires 1 April, 2006.

State of North Carolina, Department of Health and Human Services. Certificate # 37751. Dioxin in drinking water. Expires July 31, 2005.

North Dakota State Department of Health. Certificate # R-076. SDWA, Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water; **CWA,** Method 1613, PCDD/PCDF; **RCRA,** Methods 8280A/8290, PCDD/PCDF. Expires July 31, 2005.

Ohio EPA. Ohio does not offer out-of-state lab certifications; certification by EPA Region 5 is honored. Ohio EPA #29382, Analyst #9999.

2445 S. Alston Avenue, Durham NC 27713 ◎ 919-281-4040 ◎ FAX 919-281-4070 ◎ www.enoriverlabs.com

Oklahoma Department of Environmental Quality. Laboratory #9951. 2,3,7,8 TCDD (Dioxin). Expires August 31, 2005.

Secondary NELAP Certificate: **Oregon Environmental Laboratory Accreditation Program, Certificate No:-NC200001-002. SDWA,** Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water; **CWA,** Method 1613, PCDD/PCDF; **RCRA,** Methods 8280/8290, PCDD/PCDFs. Expires January 31, 2006.

Pennsylvania Department of Environmental Protection. 2,3,7,8 TCDD (Dioxin) in Drinking water, EPA 1613 . Expires July 9, 2005.

State of Tennessee. Department of Environment and Conservation. ID #02992. Dioxin in Drinking water. Expires July 30, 2005.

Texas Natural Resource Conservation Commission. Certification Number: TX264-2002A. SDWA: Chemistry, Dioxin (2378-TCDD), EPA 1613. Expires March 31, 2006.

U.S. EPA Region V. 2,3,7,8 TCDD (Dioxin) in drinking water by method 1613B. Expires February 03, 2006. [Illinois, Indiana, Michigan, Minnesota, Ohio and Wisconsin]

U.S. EPA Region VIII, for the State of Wyoming. EPA Method 1613 for Dioxin in drinking water. Expires 20 October 2005.

U.S. Navy, NFESC IR QA; NFESC 413. Acceptance to perform samples analysis; water and solids by EPA Methods 8280A, 8290 and 1613B. Expires April 21, 2006.

Secondary NELAP Certificate: **State of Utah, Department of Health. ID # TRIA, Account # 9195445729 SDWA**, Method 1613, 2,3,7,8-TCDD for Dioxin in Drinking Water; CWA, Method 1613, PCDD/PCDF & totals; RCRA, Methods 8280/8290, PCDD/PCDF & totals. Expires June 30, 2005.

Commonwealth of Virginia, Department of General Services, Division of Consolidated Laboratory Services. ID # 00341. 2,3,7,8-TCDD (Dioxin) in drinking water, EPA Method 1613B. Expires June 30, 2005.

State of Washington, Department of Ecology. Lab Accreditation Number C067. Scope of Accreditation applies to Dioxins (PCDDs/PCDFs) by EPA methods 1613, 8280, and 8290 in potable and non-potable water. Expires February 8, 2005.

State of West Virginia, Department of Health & Human Resources. Certificate No. 9923C. 2,3,7,8-TCDD (Dioxin), 1613B. Expires December 31, 2005.

State of Wisconsin, Department of Natural Resources. Laboratory ID Number 999869530. Certified for 2,3,7,8-TCDD (Dioxin) in drinking water and for PCDD/PCDF. Expires August 31, 2005.

2445 S. Alston Avenue, Durham NC 27713 ◎ 919-281-4040 ◎ FAX 919-281-4070 ◎ www.enoriverlabs.com

PHARMACEUTICAL

Clinical Laboratory Improvement Amendments (CLIA) Registration. ID # 34D0705123. Department of Health & Human Services, Health Care Financing Administration. Certificate for the Acceptance of Human Specimens for the purposes of performing laboratory examinations or procedures - Chemistry, Toxicology, HCFA. Expires May 30, 2005.

U.S. Dept of Justice, Drug Enforcement Agency (DEA). Registration number RE0317811. Controlled substance registration for schedules 1,2,3,3N,4,5. Expires 8/31/05.

N.C. Department of Health and Human Services. Registration number NC-PE 0000 2493. North Carolina controlled substances registration for schedules 1, 2, 2N, 3, 3N, 4, 5, 6. Expires 10/31/2005.

Food & Drug Administration (FDA) Registration. ID #'s 001500 3004570112. Annual registration of drug establishment.

OTHER

U.S. Department of Agriculture Soil Permit. Permit No. S-68701. Under the authority of the Federal Plant Pest Act, permission is granted to receive foreign soil samples for use in laboratory analysis. Expires September 30, 2009.

U.S. EPA Large Quantity Hazardous Waste Generator. EPA ID #NCR000137232. Permit indicates that the laboratory is a large generator of hazardous waste. No expiration date.

U.S. Fish and Wildlife Permit. Number LE027890-1. Authorization to import/export wildlife and/or wildlife products. Expires April 30, 2005.

Data Review By: PAB 5/17/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside ratio limits has been recalculated according to method requirements.

Page No. 1 Listing of T051458B.dbf

Initial ....Date...

Data Review By: KW 5/11/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside ratio limits has been recalculated according to method requirements.

Data Review By: PAB 5/3/05

Channel specific noise levels computed from 'NL' heights.

The Total Area for each peak with an ion abundance ratio outside
ratio limits has been recalculated according to method requirements.

CASE NARRATIVE

Laboratory number:	**179089**
Client:	**Mactec, Inc.**
Project:	**57255 001 22**
Location:	**Presidio / Baker Beach**
Request Date:	**04/26/05**
Samples Received:	**04/26/05**

This hardcopy data package contains sample and QC results for three soil samples, requested for the above referenced project on 04/26/05. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
Encore samples not analyzed within 48 hours were frozen. Gasoline C7-C12 was detected between the MDL and the RL in the method blank for batch 101466; this analyte was not detected in samples at or above the RL. No other analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
Low response was observed for bromomethane in the ICV analyzed 03/30/05 21:59; this analyte was not detected at or above the RL in the associated samples. Low response was observed for chloromethane in the CCV analyzed 04/26/05 11:24; this analyte met minimum response criteria. High response was observed for naphthalene; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
High response was observed for dibenz(a,h)anthracene in the CCV analyzed 05/04/05 08:48; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Pesticides (EPA 8081A):
Low response was observed for 4,4'-DDT in the ICV analyzed 04/29/05 01:54; average ICV drift met method requirements. Low responses were observed for 4,4'-DDT and methoxychlor in the CCV analyzed 05/03/05 23:33; average CCV drift met method requirements. No other analytical problems were encountered.

Metals (EPA 6020 and EPA 7471A):
Low recoveries were observed for copper and zinc in the MS/MSD for batch 101496; the parent sample was not a project sample, and the BS/BSD were within limits. No other analytical problems were encountered.

Moisture (ASTM D2216/CLP):
No analytical problems were encountered.

Calibration Standard QC Report

Data File: C:\ICPCHEM\1\DATA\05E0913a.B\009CALI.D\009CALI.D#
Date Acquired: May 9 2005 01:49 pm
Operator:
Sample Name: cs6,s394
Misc Info:
Vial Number: 1107
Current Method: C:\ICPCHEM\1\METHODS\60200111.M
Calibration File: C:\ICPCHEM\1\CALIB\60200111.C
Last Cal Update: May 09 2005 01:46 pm
Sample Type: CalStd
Total Dil Factor: 1.00
